food process engineering a branch of both food science and chemical engineering has evolved over the years since its inception and still is a rapidly changing discipline while traditionally the main objective of food process engineering was preservation and stabilization the focus today has shifted to enhance health aspects flavour and taste nutrition sustainable production food security and also to ensure more diversity for the increasing demand of consumers the food industry is becoming increasingly competitive and dynamic and strives to develop high quality freshly prepared food products to achieve this objective food manufacturers are today presented with a growing array of new technologies that have the potential to improve or replace conventional processing technologies to deliver higher quality and better consumer targeted food products which meet many if not all of the demands of the modern consumer these new or innovative technologies are in various stages of development including some still at the r d stage and others that have been commercialised as alternatives to conventional processing technologies food process engineering comprises a series of unit operations traditionally applied in the food industry one major component of these operations relates to the application of heat directly or indirectly to provide foods free from pathogenic microorganisms but also to enhance or intensify other processes such as extraction separation or modification of components the last three decades have also witnessed the advent and adaptation of several operations processes and techniques aimed at producing high quality foods with minimum alteration of sensory and nutritive properties some of these innovative technologies have significantly reduced the thermal component in food processing offering alternative nonthermal methods food processing technologies a comprehensive review three volume set covers the latest advances in innovative and nonthermal processing such as high pressure pulsed electric fields radiofrequency high intensity pulsed light ultrasound irradiation and new hurdle technology each section will have an introductory article covering the basic principles and applications of each technology and in depth articles covering the currently available equipment

and or the current state of development food quality and safety application to various sectors food laws and regulations consumer acceptance advancements and future scope it will also contain case studies and examples to illustrate state of the art applications each section will serve as an excellent reference to food industry professionals involved in the processing of a wide range of food categories e g meat seafood beverage dairy eggs fruits and vegetable products spices herbs among others

dry sulfurization processes offer the significant advantages of low capital and low operating costs when compared to wet desulfurization they hold great potential for the economical reduction of sulfur emissions from power utilities that use high sulfur coal dry scrubbing technologies for flue gas desulfurization represents a body of research that was sponsored by the state of ohio s coal development office for the development of technologies that use coal in an economic environmentally sound manner one of the project s major goals was the development of dry calcium based sorption processes for removing sulfur dioxide from the combustion gases produced by high sulfur coal dry scrubbing technologies for flue gas desulfurization highlights a number of fundamental research findings that have had a significant and lasting impact in terms of scientific understanding for example the experimental investigation of the upper furnace sulfur capture obtained time resolved kinetic data in less than 100 millisecond time scales for the first time ever thereby revealing the true nature of the ultra fast and overlapping phenomena this was accomplished through the development of a unique entrained flow reactor system the authors also identify a number of important areas for future research including reaction mechanisms sorbent material transport effects modeling and process development dry scrubbing technologies for flue gas desulfurization will appeal to both chemical and environmental engineers who examine different ways touse coal in a more environmentally benign manner it will make an essential reference for air pollution control

this book does not give a prediction of what the efficiency will be of the energy use of industrial processes in the future however it does give an exploration of limits to the efficiency of current processes and an indication of what might be achieved if new technologies can be developed at the department of science technology and society of utrecht university research had been done to the opportunities for improvement of the energy efficiency in the short term since the 1980 s this had resulted in a comprehensive database on energy efficient measures this database and a possible application are described in chapter 3 of this book the use of the database induced new research themes around efficiency improvement e g concerning barriers for implementation of measures it was around 1993 that i did a preliminary study to the potential for efficiency improvement in the long term historical analysis had shown us that the short term potential stayed constant over the years it seemed to be replenished by the introduction of new technologies this lead to the question whether there are limits to the efficiency taking into account both thermodynamic considerations and ideas on the development and dissemination of new
