the field of complex network exploded since the 1990s the number of publications in a variety of different areas has grown exponentially and practically and every discipline started to recognize the presence of these mathematical structures in its area of research actually almost any system from the nowadays traditional example of the internet to complex patterns of metabolic reactions can be analyzed through the graph theory in its simplest and non rigorous definition a graph is a mathematical object consisting of a set of elements vertices and a series of links between these vertices edges this is of course a very general description and as any mathematical abstraction the idea is to discard many of the particular properties of the phenomenon studied nevertheless this modeling is remarkably accurate for a variety of situations vertices can be persons related by friendship or acquaintances relations vertices can be proteins connected with one another if they interact in the cell networks have always existed in nature of course but it is fair to say that given the present technological explosion they became more and more important starting from the internet the web of connections between computers we started to link and share our documents through web applications and we start to get connected with a number of persons larger than usual it is this revolution in our daily habit that made natural thinking of networks in science and research once this has been realized it became natural to see the cell as a network

of molecular events from chemical reactions to gene expressions the point is to establish if this new perspective can help researchers in finding new results and by understanding the development of these phenomena and possibly control their evolution we believe that this is the case and in the following we shall provide the evidence of that together with applications there are of course true scientific questions attached to network theory consider the various ways in which the edges are distributed among the vertices even by keeping the number of edges and vertices constant we have many different patterns possible interestingly some features used to describe these shapes are not related to the particular example considered but instead they are universal that is to say they can be found in almost any network around in this book we introduce the subject of complex networks and we present the structure of the associated topics that range from social science to biology and finance we start by considering the mathematical foundations of networks and we then move to an overview of the various applications

this book is designed for introductory one semester or one year courses in communications networks in upper level undergraduate programs the second half of the book can be used in more advanced courses as pre requisites the book assumes a general knowledge of computer systems and programming and elementary calculus the second edition expands on the success of the first edition by updating on technological changes in networks and responding to comprehensive market feedback

post crisis dynamics show a shrinkage in the overall amount of crossborder bank lending which has been interpreted in the literature as a retreat in financial globalization in this paper we argue that aggregate figures are not sufficient to support such a claim in terms of the overall structure of the global banking network based on a systematic approach to measuring mapping and analyzing financial interconnectedness among countries using network theory we show that despite the decline in aggregate lending volumes the structure of the network has developed increased connections in some dimensions some parts of the network are currently more interlinked regionally than before the crisis and less dependent on major global lenders in this context at a more disaggregate level we document the characteristics of the increasing regionalization of lending flows the different evolution of linkages through bank affiliates and direct cross border claims as well as the shift in the importance of key borrower and lender nodes these changes in the banking network have important insights in terms of policy implications since they indicate that the global banking network has evolved but it has not undergone a generalized retrenchment in financial linkages
